

CONTROLLED NO-SECRET REGISTER

Production Account and Access Register - Phase 1

Ownership, recovery and credential-control metadata

Field	Controlled value
Document ID	UMWS-P1-AR-001
Version	1.0
Issue date	22 August 2026
Register owners	Jose and Raisa
Business / client operations owner	Raisa
Technical / infrastructure owner	Jose
Final pack approver	Raisa
Classification	Operational metadata only - no secret values

PROHIBITED CONTENT

This document must never contain passwords, API keys, access tokens, database URLs, private keys, recovery codes, one-time codes, signed URLs or backup passphrases. Those values remain only in the approved provider secret store or credential manager.

Register scope

- Identify the legal/business owner and authorized operators.
- Record billing/recovery routing without exposing secret values.
- Name 2FA/recovery custodians and collaboration boundaries.
- Record secret location by system, not the value.
- Define review, rotation, expiry and recovery-test expectations.

1. Control model and status vocabulary

Confirmed continuity model

Responsibility	Confirmed owner
Client operations	Raisa
Technical runbook and infrastructure response	Jose
Account register maintenance	Jose and Raisa
Authority to pause sales	Raisa
Emergency escalation	Direct Jose-Raisa WhatsApp conversation
Shared alert mailbox	usemewithstyle.master@gmail.com - controlled by Jose and Raisa

Register statuses

Status	Meaning
Verified	Control or recovery path was directly exercised or evidenced during Phase 1 closeout.
Owner-confirmed	Jose and/or Raisa confirmed control; sensitive details are intentionally excluded.
Deferred activation	Account/access exists or onboarding is controlled, but the production integration is not live in Phase 1.
Review required	Ownership exists but metadata must be reconfirmed at the stated review trigger.
ACCESS PRINCIPLE Use named individual access and provider collaboration features wherever supported. Do not share a single password when a provider can grant separate authorized users.	

Review triggers

- Quarterly access review.
- Any staff, contractor or ownership change.
- Suspected exposure or device loss.
- Provider expiry notice or permission change.
- Before activating a deferred payment or fiscal integration.
- At the start and end of each project phase.

2. Core production infrastructure accounts

System	Business / control owner	Authorized operation	2FA / recovery custodian	Status
Namecheap	Use Me With Style / Raisa; shared control	Jose and Raisa	Jose and Raisa; recovery details held in provider account	Owner-confirmed; production DNS active
Vercel	Project controlled by Jose	Jose	Jose	Verified through production deployments
Railway	Use Me With Style; shared control	Jose and Raisa; Jose recovery operator	Jose and Raisa	Verified service and PostgreSQL recovery
Cloudflare / R2	Use Me With Style; shared control	Jose and Raisa; Jose recovery operator	Jose and Raisa	Verified R2 recovery rehearsal
GitHub	Repositories controlled by Jose	Jose	Jose	Verified PR, Actions and release control
PostgreSQL	Use Me With Style via Railway	Jose recovery; app service runtime	Inherited from Railway control	Verified backup and isolated restore

Billing and recovery routing

- Provider-specific billing and recovery addresses remain in each provider account and are reviewed by the account owners.
- The shared master mailbox is the operational alert and recovery-coordination mailbox; this register does not claim it is the primary login for every provider.
- Vercel and GitHub continuity currently depends on Jose's control, explicitly accepted for Phase 1.

Vendor support route

Provider	Approved support route
Namecheap	Authenticated account support and provider status page
Vercel	Project dashboard support and status page
Railway	Project dashboard support and status page
Cloudflare	Account support and Cloudflare status page
GitHub	Repository/Actions status and GitHub Support

3. Communications, email and messaging accounts

System	Control / operators	Secret location category	Expiry / rotation	Recovery evidence
Shared master Gmail	Jose and Raisa	Google account security settings; values excluded	Review quarterly and after device/owner change	Alert and manual email receipt confirmed
Resend	Jose and Raisa; Jose technical	Resend account plus production/workflow secret stores	Rotate on exposure, role change or provider requirement	Real templates, alert and canary accepted/received
support@ sender/mailbox	Raisa at delivery; Jose until delivery	Mail provider / Resend configuration	Review at delivery and quarterly	Production sender-domain operation evidenced
orders@ sender/mailbox	Raisa at delivery; Jose until delivery	Mail provider / Resend configuration	Review at delivery and quarterly	Order email operation evidenced
Meta / Instagram	Jose and Raisa; Jose technical	Meta account and production CMS secret store	Manual renewal before token expiry; no automatic rotation job	Webhook handshake verified; live round trip separately controlled

META DECISION

Instagram access-token renewal is manual. The automatic renewal workflow was removed by owner decision. Record the rotation date, owner, expiry and verification result, but never the token value.

Vendor support route

Provider	Approved support route
Google	Google account recovery and Workspace/Gmail support as applicable
Resend	Authenticated Resend support and status page
Meta	Meta Business support, app dashboard and platform status

4. Commerce, payment and application access

System	Business owner	Operators / collaborators	Phase 1 position	Activation control
AppyPay	Use Me With Style / Raisa	Jose and Raisa	Code integration exists; live launch deferred for non-code onboarding/bureaucratic completion	Before activation: confirm credentials, sandbox/live separation, success/failure/cancel tests, webhook and reconciliation
Storefront Admin	Use Me With Style / Raisa	Raisa client operations; Jose technical	Production operational	Named admin access; remove stale users; verify login after access changes
Payload CMS	Use Me With Style	Jose technical; Raisa has access but daily use minimized	Production technical/backup administration	Use only when Storefront Admin cannot perform the approved task
WhatsApp fallback	Use Me With Style / Raisa	Raisa client operations	Current manual checkout and future AppyPay fallback	Raisa controls activation/operation; Jose maintains technical path
External fiscal provider	Use Me With Style / Raisa	Not selected for Phase 1	Deferred; app-generated documents are non-fiscal	Provider selection, accountant/legal approval, sandbox proof and runbook required

NO LIVE-PAYMENT CLAIM

AppyPay access and code readiness do not mean production payments are live. Phase 1 remains manual WhatsApp checkout. Payment credentials and provider-specific alerts enter the register when production activation is authorized.

Deferred provider onboarding checklist

- 1 Confirm legal/business owner, billing contact, recovery email and provider collaborators.
- 2 Enable 2FA and record custodians without recording recovery codes.
- 3 Separate sandbox and production credentials and secret locations.
- 4 Record expiry/rotation behavior and vendor support route.
- 5 Complete controlled production tests, reconciliation and incident-response updates before launch.

5. Secret-location and rotation matrix

Credential class	Approved location	Review / rotation rule	Verification after change
Vercel public frontend variables	Vercel project environment; VITE_ values only	Review each release/environment change	Production build and storefront/API checks
Railway CMS secrets	Railway production service variables	Rotate on exposure, owner/role change or provider expiry	CMS startup, API reads and dependent storefront checks
Database credentials	Railway service reference/variables and workflow secret where required	Rotate on exposure, ownership change or database recovery	CMS connectivity, backup workflow and isolated validation
R2 access keys	Railway production variables / Cloudflare account	Rotate on exposure or permission/owner change	Exact temporary object upload/download/checksum/clean up
Resend API key	Railway and GitHub Actions secret stores	Rotate on exposure, role change or provider requirement	Canary plus authorized template receipt
Meta verification/access tokens	Railway production secret store; verification token also GitHub Actions	Manual renewal before expiry; rotate on exposure/permission change	Webhook handshake and authorized messaging test
Cron secret	CMS/Railway scheduler and GitHub Actions secrets	Rotate on exposure or service/owner change	One controlled cleanup and fresh heartbeat
Backup passphrase	GitHub Actions secret and Jose macOS Keychain	Rotate on suspected exposure or recovery-policy change	New encrypted backup and isolated decrypt/manifest test
SECRET RULE A location entry states where a secret is managed, never its value. Screenshots and evidence must redact environment values, connection strings, signed URLs and recovery material.			

6. Access review and recovery-test register

System / control	Last evidence	Result	Next review trigger
Vercel / storefront control	Phase 1 production release verification	Verified	Quarterly; ownership change; failed deployment
Railway CMS and PostgreSQL	21 Aug 2026 backup/isolated restore	Verified - 64 tables, 824 rows; 205-second restore	Quarterly recovery review; schema-heavy release
Cloudflare R2	21 Aug 2026 exact-prefix recovery rehearsal	Verified checksum and cleanup	Quarterly; storage incident; key rotation
Resend and mailboxes	21 Aug 2026 templates, alert and canary	Provider acceptance and receipt confirmed	Daily canary; sender/DNS change
GitHub Actions	21-22 Aug 2026 production workflows	Backup, heartbeat, monitor and canary successful	Workflow/secret change; quarterly access review
Meta webhook	21-22 Aug 2026 verification monitor	Handshake verified	Token/configuration change; authorized live UAT
Shared master mailbox	21 Aug 2026 alert/canary receipt	Jose confirmed receipt; shared control attested	Quarterly; device/owner change
Namecheap DNS	Production domain and sender-domain configuration	Owner-confirmed; production domains active	DNS change; recovery-contact review
AppyPay	Access/control attestation	Owner-confirmed; production activation deferred	Before live activation

Quarterly review procedure

- 1 Jose and Raisa review all providers, authorized users and recovery contacts together.
- 2 Remove obsolete collaborators and confirm least privilege.
- 3 Confirm 2FA custodians and recovery access without viewing or copying recovery codes into the register.
- 4 Review expiring credentials, billing ownership and vendor support route.
- 5 Run the minimum safe recovery/verification check and record date, operator and result.
- 6 Issue a new register version with a concise change note; retain the superseded PDF.

7. Emergency access loss and acceptance

Account access-loss procedure

- 1

Classify affected provider, production impact and whether checkout/order/inventory integrity is at risk.
- 2

Jose informs Raisa through the direct WhatsApp escalation channel. Raisa decides whether sales pause.
- 3

Use the provider's official recovery route and the confirmed recovery custodian. Never request or send recovery codes through ordinary chat.
- 4

Preserve account notifications, timestamps and provider case references without secret values.
- 5

After recovery, review sessions/collaborators, rotate affected credentials, verify service operation and update this register metadata.

Current accepted continuity limitation

Jose alone controls Vercel and GitHub. Jose and Raisa jointly control Namecheap, AppyPay, Meta/Instagram, Resend, Cloudflare/R2, Railway and the shared master mailbox. Jose explicitly accepted this continuity model for Phase 1; any ownership expansion is recorded as a later controlled access change.

Approval record

Role	Name / position	Status
Register owners	Jose and Raisa	Ownership confirmed
Technical / infrastructure owner	Jose	Confirmed
Client operations and sales-pause authority	Raisa	Confirmed
Final pack approver	Raisa	Pending final Gate 5 pack approval

CONTROL OUTCOME

The Phase 1 production account and access model is documented without secret values. Provider-specific sensitive details remain in their approved systems; this PDF is the operational index for ownership, recovery and review.
